

Renewable Energy:

We have worked on three types of projects in Renewable Energy:

1. Initial Feasibility Studies

Working for a number of Councils we have completed feasibility studies on whether particular sources of Green Energy are viable. This resulted in detailed analysis of the most beneficial source, rejecting the more costly or impractical technologies

2. Project Development

Once we have identified a clear and financially attractive route for green energy, e.g. wind turbines, Biomass, we will identify all the costs and requirements for this to be implemented. This detailed business plan can provide our clients with the information required for them to proceed or not. If the project is not viable, then we provide clear explanations why. However, if it is feasible, then our report will explain exactly why it is and the benefits to the client in proceeding.

3. Project Finance

Once a project has been developed and ready for finance, we help raise the money, using internal cash balances, debt, equity or a combination. We will assess the opportunities for grants. The range of funding requirements for current projects varies from a few thousand to tens of millions

EnvirUP is a dynamic and client focused Environmental Consultancy. It delivers pragmatic, innovative and cost effective solutions to improve the clients Environmental Sustainability profile. We help our clients to become sustainable corporate citizens
